

Hangman

Created By: Hindy Lauer

Overview

This document describes the software implementation for the classic game of hangman. This software will enable a player to play against the computer. A description of the game plus the requirements of this implementation are provided below.

The Game

A word (max 10 letters) is randomly picked by the computer. The computer generates lines for the number of letters in the word. There is a 9x3 grid of buttons, each one corresponding to a letter in the alphabet. The player clicks a letter from the alphabet that he thinks is part of the word. If he guesses correct, that button glows yellow, is disabled, the message shows: "Correct Letter. Go again.", and the letter appears on the appropriate line. If he guesses wrong, that button turns black, is disabled, the message shows: "Incorrect letter. Try again", and a body part appears on the hangman. (First a face, then eyes...) He goes again, and the game continues. If he guesses the word before the full hangman appears, a label will appear with the words "You Won!", if the full hangman appears before he guesses the word, the label will state: "You lost".

Software implementation

UI elements

The software will present the Hangman game with UI elements listed below.

- 9x3 Grid of buttons for each letter in the alphabet
- Hangman on the left side of the screen
- Row on top of the screen that has:
 - Start Button
 - Label to display game status message
- 10 labels on the bottom of the screen for the blanks.

Player modes

There is one mode of play- against the computer.

The computer randomly generates a word and the player will have to guess the word based on the number of blanks. If the player guesses the word before the man is hanged, then he wins. Otherwise, the computer wins.
